

Abstract

The present invention is directed to a system for managing environmental audit information which includes receiving environmental audit information, accessing a predetermined set of environmental audit protocols, associating the audit information with at least one of the environmental audit protocols to form at least one environmental audit record, and storing the environmental audit record. The system of the present invention may also restrict access to the audit record, such that a quality assurance reviewer may review said audit record and may designate the status of that review, but may not modify the contents of the audit record.
